Policy
Commercial Members: Managed Care (HMO and POS), PPO, and Indemnity Medicare HMO Blue℠ and Medicare PPO Blue℠ Members

Lung transplantation may be considered **MEDICALLY NECESSARY** for carefully selected patients with irreversible, progressively disabling, end-stage pulmonary disease unresponsive to maximum medical therapy.

Lobar lung transplant from a living or deceased donor may be considered **MEDICALLY NECESSARY** for carefully selected patients with end-stage pulmonary disease.

Etiologies of End-Stage Lung Disease
- Bilateral bronchiectasis
- Alpha-1 antitrypsin deficiency
- Primary pulmonary hypertension
- Cystic fibrosis (both lungs to be transplanted)
- Bronchopulmonary dysplasia
- Postinflammatory pulmonary fibrosis
- Idiopathic/interstitial pulmonary fibrosis
- Sarcoidosis
- Scleroderma
- Lymphangiomatomyosis
- Emphysema
- Eosinophilic granuloma
- Bronchiolitis obliterans
• Recurrent pulmonary embolism
• Pulmonary hypertension due to cardiac disease
• Chronic obstructive pulmonary disease
• Eisenmenger’s syndrome.

Lung or lobar lung transplants in patients with any of the following conditions are NOT MEDICALLY NECESSARY:

1. Known active malignancy, including metastatic cancer
2. Recently treated malignancy with a high risk of recurrence
   Note: the assessment of risk of recurrence of a recently treated malignancy is made by the transplant team; providers must submit a statement with an explanation of why the patient with a recently treated malignancy is an appropriate candidate for a transplant.
3. Untreated systemic infection making immunosuppression unsafe, including chronic infection
4. Other irreversible end-stage disease not attributed to lung disease
5. History of cancer with a moderate risk of recurrence
6. Systemic disease that could be exacerbated by immunosuppression
7. Psychosocial conditions or chemical dependence affecting the ability to adhere to therapy
8. Coronary artery disease not amenable to percutaneous intervention or bypass grafting, or associated with significant impairment of left ventricular function, or
9. Colonization with highly resistant or highly virulent bacteria, fungi, or mycobacteria.

Lung or lobar lung retransplantation after a failed lung or lobar lung transplant may be considered MEDICALLY NECESSARY in patients who meet criteria for lung transplantation.

Lung or lobar lung transplantation is considered INVESTIGATIONAL in all other situations.

Prior Authorization Information
Inpatient
• For services described in this policy, precertification/preauthorization IS REQUIRED for all products if the procedure is performed inpatient.

Outpatient
• For services described in this policy, see below for products where prior authorization might be required if the procedure is performed outpatient.

| Commercial Managed Care (HMO and POS) | This procedure is performed in the inpatient setting. |
| Commercial PPO and Indemnity | This procedure is performed in the inpatient setting. |
| Medicare HMO BlueSM | This procedure is performed in the inpatient setting. |
| Medicare PPO BlueSM | This procedure is performed in the inpatient setting. |

CPT Codes / HCPCS Codes / ICD Codes
Inclusion or exclusion of a code does not constitute or imply member coverage or provider reimbursement. Please refer to the member’s contract benefits in effect at the time of service to determine coverage or non-coverage as it applies to an individual member.

Providers should report all services using the most up-to-date industry-standard procedure, revenue, and diagnosis codes, including modifiers where applicable.

The following codes are included below for informational purposes only; this is not an all-inclusive list.

The above medical necessity criteria MUST be met for the following codes to be covered for Commercial Members: Managed Care (HMO and POS), PPO, Indemnity, Medicare HMO Blue and Medicare PPO Blue:

CPT Codes
CPT codes: | Code Description
---|---
32851 | Lung transplant, single; without cardiopulmonary bypass
32852 | Lung transplant, single; with cardiopulmonary bypass
32853 | Lung transplant, double (bilateral sequential or en bloc); without cardiopulmonary bypass
32854 | Lung transplant, double (bilateral sequential or en bloc); with cardiopulmonary bypass

HCPCS Codes

| HCPCS codes: | Code Description |
---|---|
S2060 | Lobar lung transplantation

ICD-10 Procedure Codes

| ICD-10-CM Diagnosis codes: | Code Description |
---|---|
0BYC0Z0 | Transplantation of Right Upper Lung Lobe, Allogeneic, Open Approach
0BYC0Z1 | Transplantation of Right Upper Lung Lobe, Syngeneic, Open Approach
0BYD0Z0 | Transplantation of Right Middle Lung Lobe, Allogeneic, Open Approach
0BYD0Z1 | Transplantation of Right Middle Lung Lobe, Syngeneic, Open Approach
0BYF0Z0 | Transplantation of Right Lower Lung Lobe, Allogeneic, Open Approach
0BYF0Z1 | Transplantation of Right Lower Lung Lobe, Syngeneic, Open Approach
0BYG0Z0 | Transplantation of Left Upper Lung Lobe, Allogeneic, Open Approach
0BYG0Z1 | Transplantation of Left Upper Lung Lobe, Syngeneic, Open Approach
0BYH0Z0 | Transplantation of Lung Lingula, Allogeneic, Open Approach
0BYH0Z1 | Transplantation of Lung Lingula, Syngeneic, Open Approach
0BYJ0Z0 | Transplantation of Left Lower Lung Lobe, Allogeneic, Open Approach
0BYJ0Z1 | Transplantation of Left Lower Lung Lobe, Syngeneic, Open Approach
0BYK0Z0 | Transplantation of Right Lung, Allogeneic, Open Approach
0BYK0Z1 | Transplantation of Right Lung, Syngeneic, Open Approach
0BYL0Z0 | Transplantation of Left Lung, Allogeneic, Open Approach
0BYL0Z1 | Transplantation of Left Lung, Syngeneic, Open Approach
0BYM0Z0 | Transplantation of Bilateral Lungs, Allogeneic, Open Approach
0BYM0Z1 | Transplantation of Bilateral Lungs, Syngeneic, Open Approach

DESCRIPTION

End-stage lung disease may derive from different etiologies. The most common indications for lung transplantation are chronic obstructive pulmonary disease, idiopathic pulmonary fibrosis, cystic fibrosis, a-antitrypsin deficiency, and idiopathic pulmonary arterial hypertension.

Before consideration for transplant, patients should be receiving maximal medical therapy, including oxygen supplementation, or surgical options, such as lung volume reduction surgery for chronic obstructive pulmonary disease. Lung or lobar lung transplantation is an option for patients with end-stage lung disease despite these measures.

A lung transplant refers to single-lung or double-lung replacement. In a single-lung transplant, only one lung from a deceased donor is provided to the recipient. In a double-lung transplant, both the recipient's lungs are removed and replaced by the donor's lungs. In a lobar transplant, a lobe of the donor's lung is excised, sized appropriately for the recipient's thoracic dimensions, and transplanted. Donors for lobar transplant have primarily been living-related donors, with one lobe obtained from each of two donors (generally friends or family members) in cases for which bilateral transplantation is required. There are also cases of cadaver lobe transplants.
Since 2005, potential recipients have been ranked according to the Lung Allocation Score. Patients 12 years of age and older receive a score between 1 and 100 based on predicted survival after transplantation reduced by predicted survival on the waiting list; the Lung Allocation Score takes into consideration the patient's disease and clinical parameters. In 2010, a simple priority system was implemented for children younger than age 12 years. Under this system, children younger than 12 years with respiratory lung failure and/or pulmonary hypertension who meet criteria are considered "priority 1" and all other candidates in the age group are considered "priority 2". A lung review board has the authority to adjust scores on appeal for adults and children.

**Summary**

A lung transplant consists of replacing all or part of diseased lungs with healthy lung(s) or lobes. Transplantation is an option for patients with end-stage lung disease.

For individuals who have end-stage pulmonary disease who receive a lung transplant, the evidence includes case series and registry studies. The relevant outcomes are overall survival, change in disease status, and treatment-related mortality and morbidity. International registry data on a large number of patients receiving lung transplantation (>50000) found relatively high patient survival rates, especially among those who survived the first year posttransplant. After adjusting for potential confounding factors, survival did not differ significantly after single- or double-lung transplant. Lung transplantation may be the only option for some patients with end-stage lung disease. The evidence is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.

For individuals who have end-stage pulmonary disease who receive a lobar lung transplant, the evidence includes case series and systematic reviews. The relevant outcomes are overall survival, change in disease status, and treatment-related mortality and morbidity. There are less data on lung lobar transplants than on whole-lung transplants, but several case series have reported reasonably similar survival outcomes between the procedures, and lung lobar transplants may be the only option for patients unable to wait for a whole-lung transplant. A 2017 systematic review found 1-year survival rates in available published studies ranging from 50% to 100%. The evidence is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.

For individuals who have a prior lung or lobar transplant who meet criteria for a lung transplant who receive a lung or lobar lung retransplant, the evidence includes case series and registry studies. The relevant outcomes are overall survival, change in disease status, treatment-related mortality and morbidity. Data from registries and case series have found favorable outcomes with lung retransplantation in patients who meet criteria for initial lung transplantation. Given the exceedingly poor survival prognosis without retransplantation of patients who have exhausted other treatments, the evidence of a moderate level of posttransplant survival may be considered sufficient in this patient population. The evidence is sufficient to determine that the technology results in a meaningful improvement in the net health outcome.
