Policy
Commercial Members: Managed Care (HMO and POS), PPO, and Indemnity Medicare HMO BlueSM and Medicare PPO BlueSM Members

Home cardiorespiratory monitoring may be considered MEDI CALLY NECESSARY when initiated in infants younger than 12 months of age in the following situations:

- Those who have experienced a brief resolved unexplained event (previously known as apparent life-threatening event) and are not considered lower risk following clinical evaluation; OR
- Those with tracheostomies or anatomic abnormalities that make them vulnerable to airway compromise; OR
- Those with neurologic or metabolic disorders affecting respiratory control, including central apnea and apnea of prematurity; OR
- Those with chronic lung disease (ie, bronchopulmonary dysplasia).

The diagnosis of bronchopulmonary dysplasia (BPD) is dependent on gestational age and is outlined in Table PG1 based on the 2001 consensus definition from the U.S. National Institute of Child Health and Human Development (Jobe et al, 2001).
### Table PG1: Diagnosis of Bronchopulmonary Dysplasia

<table>
<thead>
<tr>
<th>Diagnosis</th>
<th>Gestational Age</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&lt;32 wk</td>
</tr>
<tr>
<td>Time point of assessment</td>
<td>36 wk PMA or discharge to home, whichever comes first</td>
</tr>
<tr>
<td>Treatment</td>
<td>Treatment with Oxygen &gt;21% for at Least 28 Days Plus</td>
</tr>
</tbody>
</table>

- **Mild BPD**
  - Breathing room air at 36 wk PMA or discharge, whichever comes first
  - Breathing room air by 56 d postnatal age or discharge, whichever comes first

- **Moderate BPD**
  - Need for <30% oxygen at 36 wk PMA or discharge, whichever comes first
  - Need for <30% oxygen at 56 d postnatal age or discharge, whichever comes first

- **Severe BPD**
  - Need for ≥ 30% oxygen and/or positive pressure at 36 wk PMA or discharge, whichever comes first
  - Need for ≥30% oxygen and/or positive pressure at 56 d postnatal age or discharge, whichever comes first

Home cardiorespiratory monitoring is considered **NOT MEDICALLY NECESSARY** in infants with any siblings with a history of sudden infant death syndrome, but without at least one of the indications cited.

Home cardiorespiratory monitoring in all other conditions, including but not limited to the diagnosis of obstructive sleep apnea, is considered **INVESTIGATIONAL**.

### Prior Authorization Information

**Inpatient**
- For services described in this policy, precertification/preauthorization is required for all products if the procedure is performed inpatient.

**Outpatient**
- For services described in this policy, see below for products where prior authorization might be required if the procedure is performed outpatient.

### CPT Codes / HCPCS Codes / ICD Codes

Inclusion or exclusion of a code does not constitute or imply member coverage or provider reimbursement. Please refer to the member’s contract benefits in effect at the time of service to determine coverage or non-coverage as it applies to an individual member.

Providers should report all services using the most up-to-date industry-standard procedure, revenue, and diagnosis codes, including modifiers where applicable.

The following codes are included below for informational purposes only; this is not an all-inclusive list.

The above medical necessity criteria MUST be met for the following codes to be covered for Commercial Members: Managed Care (HMO and POS), PPO, Indemnity, Medicare HMO Blue and Medicare PPO Blue:

**CPT Codes**

### Description

#### Home Monitoring

**Apnea Monitoring**

Home cardiorespiratory monitors track respiratory effort and heart rate and have been used to monitor central apnea of prematurity in newly discharged at risk or high-risk premature infants (infants are at increased risk of cardiorespiratory events until 43 weeks of postconceptual age) and in other infants at risk of apnea. An alarm sounds if there is respiratory cessation (central apnea) beyond a predetermined time limit (eg, 20 seconds) or if the heart rate falls below a preset rate (bradycardia) to notify the parent that intervention (stimulation, mouth-to-mouth resuscitation, cardiac compressions) is required. Unless an oximeter is added to the 2-channel devices, home apnea monitors are not effective for detecting obstructive sleep apneas. False alarms due to movement artifact are common with pulse oximeters, and these devices are not intended for the diagnosis of sleep-disordered breathing in a child.

**Sudden Infant Death Syndrome**

SIDS refers to the sudden death of an infant younger than one year of age whereby the circumstances are unexplained after a thorough investigation that includes autopsy, examination of the death scene, and review of the family history. As a means to decrease the incidence of SIDS, in the 1970s, cardiorespiratory monitoring was suggested. However, clinical studies have failed to establish that the use of home monitoring reduces the incidence of SIDS. The American Academy of Pediatrics (AAP;2011) reiterated its recommendations that home monitoring should not be used as a strategy to prevent SIDS. Instead, AAP recommended that proven practices should be promoted to reduce the incidence of SIDS, which include supine sleeping, use of a firm bed surface, routine immunizations, breast-feeding, and avoidance of exposure to tobacco smoke, alcohol, and illegal drugs. One of these proven practices (supine sleeping) has been promoted in the "Safe to Sleep" campaign (formerly called the "Back to Sleep" campaign) initiated in 1994 by AAP, as well as by the National Institute of Child Health and Development and the Maternal Child Health Bureau of Human Resources and Services Administration. The campaign is a national effort to educate health care professionals, parents, and caregivers about the significance of placing infants in the supine sleeping position to reduce SIDS. The incidence of SIDS in the U. S. decreased dramatically
between 1992 and 2001, especially in the years after the first supine sleep position recommendations were issued.

**Other Indications**
Home cardiorespiratory monitors are used for reasons other than preventing SIDS. They include monitoring infants at high-risk of respiratory compromise due to chronic ventilator or oxygen requirements, tracheostomies or anatomic abnormalities that make them vulnerable to airway compromise, and central apnea, including apnea, bradycardia, and oxygen desaturations associated with prematurity. Former premature infants with bronchopulmonary dysplasia (ie, neonatal chronic lung disease), which may lead to chronic oxygen requirement, may have indications for home cardiorespiratory monitoring.

An additional potential use of home devices is monitoring infants who have had acute events associated with apnea, color change, or loss of tone. Originally, these events were referred to as apparent life-threatening events. Apparent life-threatening events was defined by a 1986 National Institutes of Health Conference as “an episode that is frightening to the observer, and that is characterized by some combination of apnea (central or occasionally obstructive), color change (usually cyanotic or pallid but occasionally erythematous or plethoric), marked change in muscle tone (usually marked limppness), choking, or gagging. In some cases, the observer fears that the infant has died.” The AAP (2016) updated a clinical practice guideline that proposed replacing the term apparent life-threatening events with the term brief resolved unexplained event, which is defined as follows:

"An event occurring in an infant younger than 1 year when the observer reports a sudden, brief, and now resolved episode of ≥1 of the following: (1) cyanosis or pallor; (2) absent, decreased, or irregular breathing; (3) marked change in tone (hyper- or hypotonia); and (4) altered level of responsiveness. A BRUE is diagnosed only when there is no explanation for a qualifying event after conducting an appropriate history and physical examination."

**Summary**
Home cardiorespiratory monitors track respiratory effort and heart rate to detect episodes of apnea. They have been used for a variety of indications that may be associated with increased risk of respiratory compromise.

For individuals who have a risk of respiratory failure in infancy who receive home cardiorespiratory monitoring, the evidence includes primarily observational studies. The relevant outcomes are overall survival and morbid events. For prevention of sudden infant death syndrome, the available published literature is primarily from a longitudinal cohort study, the Collaborative Home Infant Monitoring Evaluation study. Results from the Collaborative Home Infant Monitoring Evaluation study do not support the use of monitoring. For other respiratory conditions, there is a lack of published evidence due to small numbers of patients and the difficulty of enrolling infants with respiratory conditions. The evidence is insufficient to determine the effects of the technology on health outcomes.

Clinical input obtained in 2016 and national guidelines published by the American Academy of Pediatrics have identified specific groups of infants who might benefit from home monitoring because of other factors that increase the risk of sudden death (eg, tracheostomies, chronic lung disease). These conditions identified by the Academy as benefitting from home cardiorespiratory monitoring may, therefore, be considered medically necessary.
